Looking for an official Physical Medicine and Rehabilitation (PMR) textbook? The. Braddom's Physical Medicine And Rehabilitation (3rd. Check out updated editions of the content from previous editions in a single. Mutant frequencies in human lung tumours determined by the S-9 activation assay. A fluctuation analysis is a standard assay to study the mutagenicity of chemicals and drugs. The study of normal human cells may be hampered by the lack of data on the variability of this biological system. In order to fill the gap, we have analysed the mutagenicity of chemical carcinogens in normal human lung. The frequency of S9-sensitive colonies in the S-9 activation assay has been measured in nine lung tumours: two adenocarcinomas (Ade-C and Ade-D), one squamous carcinoma (Sq-C), two small-cell carcinomas (Sm-C

---

and Sm-D) and four bronchial carcinoid (CNR) cell lines. All of the tested cell lines showed a high spontaneous mutation frequency (up to  $2.4 \times 10^{-5}$  mutations/survival cell). Mutations were observed in all cell lines after treatment with 7,12-dimethylbenz[alpha]anthracene, ethyl methanesulphonate and benzo[alpha]pyrene-trans-7,8-diol, but not after N-methyl-N'-nitro-N-nitrosoguanidine treatment. However, dose-response curves obtained by fluctuation analyses with N-methyl-N'-nitro-N-nitrosoguanidine showed that it was mutagenic only in the most sensitive cell line Ade-C. In the other tumours, only marginal increases in the mutation frequencies occurred. Further analyses of the patterns of spontaneous and induced mutations revealed that they were mainly T-->C and T-->A transitions. These results demonstrate that a standard fluctuation assay can be performed on normal human lung.

Mayor Jones claims that the recommended salary increase will be "maximum." Don't take this claim at face value. The proposed increase is absolutely lower than what was offered last time. This may well be a violation of the city

---

charter, but it is certainly a precedent-setting decision. It is also highly probable that this increase will pass the "discretionary authority" test
